## TAKE HOME MESSAGE

- Many ILD patients present in ICU with respiratory distress.
- Respiratory distress could be due to rapid progression of the disease or it could be an acute exacerbation of ILD also.
- Acute exacerbation of ILD is a distinct clinical entity which is usually treated with steroids(weak recommendation) and antibiotics.
- While taking into decision of ventilation patient's background working status is very important. Acute exacerbation of IPF has the worse prognosis as compared to acute exacerbation of non-IPF ILD.

### TAKE HOME MESSAGE

CPAP increase TV significantly

**T/F**

Increase in PS can increase in TV:

**T/F**

In CHF CPAP is better than BPAP:

**T/F** (Probably equal if same EPAP)

With hypercarbia and AMS, NIV is absolutely contraindicated:

**T/F**

NIV has not shown to improve survival in Chronic CHF
